Impressive in breadth and depth, yet written with clarity in an engaging, nontechnical style, this fascinating tour of the brain provides the general reader with the latest information on one of the most intriguing and burgeoning areas of scientific research. No topic has more meaning or relevance than using our brains to understand the working of our own minds.

R. Grant Steen, PhD (Chapel Hill, NC) is a neurophysiologist and associate professor of psychiatry at the University of North Carolina School of Medicine, Chapel Hill. He has authored or edited four books including the highly acclaimed *DNA & Destiny: Nature and Nurture in Human Behavior*, in addition to nearly seventy research papers.

*"Grant Steen's **The Evolving Brain** goes a very long way toward providing an accessible view of the inner workings of the human brain for the nonscientist reader. The book is well conceived, informative, and highly engaging. With this book, Steen accomplishes a goal that is too rarely attempted—he does a masterful job of bridging the ever-widening gulf between science and the general public."*

*"Understanding the 100 billion neurons that comprise a brain is both a daunting challenge for science and one of critical importance for humankind. **The Evolving Brain** is a thoughtful and highly engaging introduction to the brain, its evolving complexity, and our emerging understanding of how it functions. Questions posed by Dr. Steen concerning the brain, mind, and society are timely and worthy of consideration. I highly recommend this book."*

—STEPHEN R. DAGER, MD

Professor of Radiology and Adjunct Professor of Psychiatry and Bioengineering, University of Washington School of Medicine

*"In Hercules' battle with the Hydra, each time he lopped off one of the mighty monster's nine heads two heads grew back in its place. Scientists studying the brain struggle with a similar dilemma—as research advances, answering one question seems to generate two more new questions, each more challenging than the original. In **The Evolving Brain**, esteemed neuroscientist R. Grant Steen takes on the Hydra with a broad synthesis of our current understanding of how the brain works while at the same time elucidating the unanswered questions at the forefront of research. From a clear description of the mechanics of single neurons, through the nature of the interactions among them, which lead to behavior, consciousness, and the individual differences among us, Dr. Steen takes us on a journey of emerging complexity that carries implications for society and the future of our species. The result is a fact-filled and highly readable book that is sure to inform and stimulate the curiosity of all who have wondered about the three-pound mass of tissue responsible for all that we think, all that we feel, all that we do, and all that we are."*
